DETAILED ACTION

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

- (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 1. Claims 1, 2, 4, 6-8 and 14 are rejected under 35 U.S.C. 103(a) as being unpatentable over Ward (4,076,098) in view of Mizone (7,123,738) and Ono (JP 63187900 A). Ward teaches a loudspeaker diaphragm comprising a base layer (Figure 1, #11) having a woven fabric of a fiber impregnated with a thermosetting melanine resin (Col. 1, Lines 51-53), whereby the fiber is coated with a second thermosetting resin (Col. 2, Lines 56-58) containing a thermoplastic elastomer (Col. 2, Lines 5-12). Ward fails to teach wherein the base is made of polyethylene naphthalate, and wherein the polyethylene naphthalate fiber is an untwisted fiber. Mizone teaches a base layer made of a polyethylene naphthalate fiber impregnated (Col 1, Lines 26-34). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the apparatus of Ward, with the apparatus of Mizone to provide a speaker diaphragm that is light weight, provides larger internal loss, is excellent in rigidity and provides excellent sound quality. One teaches a diaphragm having a woven base made of an untwisted fiber or roving monofilament (See Abstract). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the apparatus of Ward as modified, with the apparatus of Ono to provide a speaker with

excellent sound frequency characteristics by using a roving (untwisted) base member when used in combaintion. Ward, Mizone and Ono fail to teach a fiber/resin ratio in the base layer is in the range of 60/40 to 80/20 by weight. However, It would have been obvious to one of ordinary skill in the art at the time the invention was made to provide a fiber/resin ratio in the base layer in the range of 60/40 to 80/20 by weight, since it has been held that where the general conditions of a claim are disclosed in the prior art, discovering the optimum or working range involves only routine skill in the art. In re Aller, 105 USPQ 233. Further, it has been held to be within the general skill of a worker in the art to select a known material on the basis of its suitability for the intended use as a matter of obvious design choice. In re Leshin, 125 USPQ 416. Still Further, it has been held that a recitation with respect to the manner in which a claimed apparatus is intended to be employed does not differentiate the claimed apparatus from a prior art apparatus satisfying the claimed structural limitations.

2. Claims 9-12 and 15-17 is rejected under 35 U.S.C. 103(a) as being unpatentable over Ward (4,076,098) in view of Mizone (7,123,738), Ono (JP 63187900 A) and Kanada (US 2002/0045040). Ward teaches a loudspeaker diaphragm comprising a base layer (Figure 1, #11) having a woven fabric of a fiber impregnated with a thermosetting melanine resin (Col. 1, Lines 51-53), whereby the fiber is coated with a second thermosetting resin (Col. 2, Lines 56-58); and curing the thermosetting resin, so as to form a base layer (Col. 2, Lines 33-38). Ward fails to teach wherein the base is made of polyethylene naphthalate,; and wherein the polyethylene naphthalate fiber is an untwisted fiber; a thermoplastic elastomer layer; adding the inactive gas, carbon dioxide, in a supercritical state to a molten thermoplastic resin and extruding the mixture

of the thermoplastic resin and the inactive gas at prescribed temperature and pressure, so as to form a thermoplastic resin layer; and laminating the base layer and the thermoplastic resin layer; a thermoplastic elastomer layer containing at least one selected from the group consisting of a polyester elastomer, a polyurethane elastomer and a polyolefin elastomer; and a foamed structure, wherein an average diameter of a cell in the foamed structure is 10 to 60 µm. Mizone teaches a base layer made of a polyethylene naphthalate fiber impregnated (Col 1, Lines 26-34). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the apparatus of Ward, with the apparatus of Mizone to provide a speaker diaphragm that is light weight, provides larger internal loss, is excellent in rigidity and provides excellent sound quality. Ono teaches a diaphragm having a woven base made of an untwisted fiber or roving monofilament (See Abstract). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the apparatus of Ward as modified, with the apparatus of Ono to provide a speaker with excellent sound frequency characteristics by using a roving (untwisted) base member when used in combaintion. Kanada teaches a thermoplastic elastomer layer (Page 2, [0014]); adding the inactive gas, carbon dioxide, in a supercritical state to a molten thermoplastic resin and extruding the mixture of the thermoplastic resin and the inactive gas at prescribed temperature and pressure, so as to form a thermoplastic resin layer; and laminating the base layer and the thermoplastic resin layer (Page 2, [0018]); a thermoplastic elastomer layer containing at least one selected from the group consisting of a polyester elastomer, a polyurethane elastomer and a polyolefin elastomer (Page 2, [0014]); and a foamed structure (Page 3, [0021]), wherein an average diameter of a cell in the foamed

Art Unit: 2837 -

structure is 10 to 60 µm (Page 3, [0026]). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the apparatus of Ward as modified, with the apparatus of Kanada in order to provide a laminate that is thin and has excellent flexibility, while maintaining a high level of soundproofing characteristics.

- 3. Claims 18-20 are rejected under 35 U.S.C. 103(a) as being unpatentable over Ward (4,076,098), Mizone (7,123,738), Ono (JP 63187900 A) and Kanada (US 2002/0045040) as applied to claim 17 above, and further in view of Yamaji (5,055,341). Ward, Mizone, Ono and Kanada are relied upon for the reasons and disclosures set forth above. One further teaches a base fiber (6) being a monofilament (5) (See Abstract). Ward, Mizone, One and Kanada fail to teach a thermoplastic resin layer composed of a film; and the thermoplastic elastomer constituting the thermoplastic elastomer layer having a melting point higher than that of a thermoplastic resin constituting the thermoplastic resin layer. Yamaji teaches a thermoplastic resin layer as an intermediate layer composed of a film (Col. 5, Lines 57-61); and the thermoplastic elastomer constituting the thermoplastic elastomer layer having a melting point higher than that of a thermoplastic resin constituting the thermoplastic resin layer (Col. 6, Lines 23-35). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the apparatus of Ward as modified, with the apparatus of Yamaji because of their lightweight and heat resistant characteristics, as well as high productivity at a low cost.
- 4. Claim 13 is rejected under 35 U.S.C. 103(a) as being unpatentable over Ward (4,076,098), Mizone (7,123,738) and Ono (JP 63187900 A) as applied to claim 1 above, and further in view of Thomas (EP 0508596 A1). Ward, Mizone and Ono are relied

upon for the reasons and disclosures set forth above. Ward, Mizone and Ono fail to disclose a base layer comprising an unwoven fabric of a liquid crystal polymer. Thomas discloses a base layer comprising an unwoven fabric of a liquid crystal polymer (Col.1, Lines 34-42). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the apparatus of Ward as modified, with the apparatus of Thomas because a liquid crystal polymer provides substantially better resistance to moisture and to elevated temperature than traditional materials, as well as its good fatigue resistance to survive the rigors of high output sound reproduction over extended periods of time.

5. Claim 5 is rejected under 35 U.S.C. 103(a) as being unpatentable over Ward (4,076,098) and Mizone (7,123,738) and Ono (JP 63187900 A), as applied to Claim 4 above, and further in view of Inoue (6,378,649) and Ogura (5,744,761). Ward, Mizone and Ono are relied upon for the reasons and disclosures set forth above. Ward, Mizone and Ono fail to teach a thermosetting resin as an unsaturated polyester resin and a second thermosetting resin as an epoxy resin or a melamine resin. Inoue discloses a thermosetting resin as an unsaturated polyester resin (Col. 3, Lines 11-12). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the apparatus of Ward as modified, with the apparatus of Inoue for their high elasticity and large internal loss, while providing excellent flexibility. Inoue fails to disclose a second thermosetting resin as an epoxy resin or a melamine resin. Ogura disclose a second thermosetting resin as an epoxy resin or a melamine resin (Col. 5, Lines 27-32). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the apparatus of Ward as modified, with the apparatus of

Ogura because they are sufficient to impart stiffness on a cloth after cooling to ambient temperatures.

Response to Arguments

- 6. Applicant's arguments with respect to claims 1, 2 and 4-20 have been considered but are most in view of the new ground(s) of rejection. The Examiner considers the obvious combination of Ward, Mizone, Ono, Kanada, Yamaji, Thomas, Inoue and Ogura to teach all of the limitations as claimed by Applicant.
- In response to applicant's argument that there is no suggestion to combine the references, the examiner recognizes that obviousness can only be established by combining or modifying the teachings of the prior art to produce the claimed invention where there is some teaching, suggestion, or motivation to do so found either in the references themselves or in the knowledge generally available to one of ordinary skill in the art. See In re Fine, 837 F.2d 1071, 5 USPQ2d 1596 (Fed. Cir. 1988), and In re Jones, 958 F.2d 347, 21 USPQ2d 1941 (Fed. Cir. 1992). In this case, Claims 1-20 are directed toward a loudspeaker having a balance between rigidity and internal loss. To achieve this balance, applicant has combined materials and methods well known in the art of general acoustics. Because the prior art of Ward, Mizone, Ono, Kanada, Yamaji, Thomas, Inoue and Ogura all having teachings with the art of acoustics, there is motivation to combine as cited in the preceding office action. Further, the test for obviousness is not whether the features of a secondary reference may be bodily incorporated into the structure of the primary reference; nor is it that the claimed invention must be expressly suggested in any one or all of the references. Rather, the

test is what the combined teachings of the references would have suggested to those of ordinary skill in the art. See In re Keller, 642 F.2d 413, 208 USPQ 871 (CCPA 1981). Further, In response to applicant's argument that the prior art is nonanalogous art, it has been held that a prior art reference must either be in the field of applicant's endeavor or, if not, then be reasonably pertinent to the particular problem with which the applicant was concerned, in order to be relied upon as a basis for rejection of the claimed invention. See In re Oetiker, 977 F.2d 1443, 24 USPQ2d 1443 (Fed. Cir. 1992). In this case, one of ordinary skill in the art of general acoustics would recognize the obvious combination of the prior art references cited above to achieve desired acoustical and structural characteristics. In response to applicant's argument that the examiner's conclusion of obviousness is based upon improper hindsight reasoning, it must be recognized that any judgment on obviousness is in a sense necessarily a reconstruction based upon hindsight reasoning. But so long as it takes into account only knowledge which was within the level of ordinary skill at the time the claimed invention was made, and does not include knowledge gleaned only from the applicant's disclosure, such a reconstruction is proper. See In re McLaughlin, 443 F.2d 1392, 170 USPQ 209 (CCPA 1971).

Conclusion

8. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Pertinent arts of record relating to loudspeaker diaphragms and the method for manufacturing the same are disclosed in the PTO-892.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Jeremy Luks whose telephone number is (571) 272-

2707. The examiner can normally be reached on Monday-Thursday 8:30-6:00, and alternating Fridays.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Lincoln Donovan can be reached on (571) 272-1988. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
